

ABSTRACT

An object of the present invention is to provide a medicine wrapping machine which wraps each administered
5 amount of a medicine in a medicine wrapping sheet, and enables easy opening even by an aged person or a child. The medicine wrapping machine uses a belt-shaped medicine wrapping sheet, and forms a plurality of divided wrapping bags continuous in a state of containing medicines therein
10 and separated at the time of taking the medicines to wrap the medicines. A raw material of the medicine wrapping sheet is a belt-shaped transparent composite plastic sheet which includes a polyethylene terephthalate (PET) sheet or a biaxially oriented polypropylene sheet, and a minute flaw is
15 formed on the polyethylene terephthalate sheet or the biaxially oriented polypropylene sheet.
